

- Simple fillings (white fillings) synthetic resin
- Complex synthetic resin fillings
- Recovery of teeth with intra-root axis and synthetic resin
- Inserts – Epenthesis by porcelain or metal (gold, etc.)

If you have a cavity or tooth that needs repair or even old mercury fillings you would like to replace for cosmetic reasons, white fillings may be just what you are looking for to give you that perfect smile. White fillings look great, function correctly, are healthy and will last for many years to come.

Modern white fillings are a combination of a resin and nano-particles of glass. This combination gives white fillings their dental name; composite resins. Composite resins are tooth coloured materials that are not only durable and long lasting but attractive as well. They are bonded directly to the tooth thus adding to the strength of it. The variety of shades and colours of the composites allow the dentist to create a natural looking filling on your tooth, making a difference in your appearance, especially if the restoration is visible when you smile.
